

# NotebookLM-CLI One-Click Kit

A Windows toolkit that installs, runs, and manages Google **NotebookLM** (an AI notebook that reads and summarizes your sources) with **a single double-click**, and connects it to AI assistants (Claude Code · Cursor, etc.). **No commands required — just pick a number from the menu.**

License **Apache-2.0**

Platform **Windows 10/11**

PyPI **notebooklm-mcp-cli**

🌐 **Language:** 한국어 · **English (this file)** 📖 Gentler walkthrough: **GUIDE.en.md** (full beginner guide)

## Overview

**NotebookLM-CLI One-Click Kit** is a Windows toolkit that wraps the [notebooklm-mcp-cli](#) PyPI package so that **anyone** can connect Google [NotebookLM](#) to AI tools like Claude Code · Cursor · VS Code · Gemini CLI — **no coding required**.

- Even if you don't code or have never used a terminal, just **double-click** **시작하기.bat** (Start Here).
- Install → log in → (optional) connect AI tool → use — all by **picking numbers** in a black window.

| Item            | Value                                                                      |
|-----------------|----------------------------------------------------------------------------|
| Audience        | Total beginners to computers / AI                                          |
| OS              | Windows 10 / 11 (Windows only)                                             |
| Difficulty      | ★☆☆ (double-click + pick a number)                                         |
| Cost            | Kit & underlying tool are <b>free</b> (NotebookLM follows Google's policy) |
| Kit license     | <b>Apache-2.0</b> (commercial use allowed, with conditions — §16)          |
| Underlying tool | <code>notebooklm-mcp-cli</code> ( <b>MIT License</b> , a separate package) |

## Features

| Feature                                                                                                 | Description                                                                                      |
|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|  One-click install     | Auto-detects Python and installs the package via <code>uv</code> (preferred) or <code>pip</code> |
|  Easy Start (S)        | Guides login → AI connection → first notebook in one flow                                        |
|  Google login        | Auto login via Chrome / manual cookie-file login / per-profile (account)                         |
|  MCP server          | Start the MCP server for Claude Code · Cursor · VS Code · Gemini CLI                             |
|  Notebook management | List / create notebooks / run commands directly                                                  |
|  Update              | Normal upgrade / force-reinstall the latest                                                      |
|  Diagnose            | <code>n1m doctor</code> auto-checks install & login problems                                     |
|  Clean uninstall     | Removes package + auth data + AI links safely (Python is kept)                                   |
|  Glossary (T)        | Explains MCP·pip and other jargon in plain words                                                 |

## Prerequisites / Requirements

### Prepare yourself (3 things)

| Item           | Why                                                        | If you don't have it                                                                     |
|----------------|------------------------------------------------------------|------------------------------------------------------------------------------------------|
| Internet       | Programs are downloaded online                             | Connect Wi-Fi / LAN                                                                      |
| Google account | NotebookLM is a Google service (your everyday Gmail works) | Sign up free at <a href="https://accounts.google.com">https://accounts.google.com</a>    |
| Chrome         | Used to show the <b>login window</b>                       | Install from <a href="https://www.google.com/chrome/">https://www.google.com/chrome/</a> |

### Auto-handled (you can ignore)

- **Python 3.10–3.13** — the runtime. If missing, the installer **tells you how to get it**.
- **uv / pip** — installer helpers, handled **automatically** (uv first → pip fallback).
- **notebooklm-mcp-cli** — the actual tool (command `nlm`), downloaded **automatically** from PyPI.

💡 If you install Python yourself, **check "Add Python to PATH"** on the very first screen. Verify Python: `Start menu → cmd → py --version`.

## Download / Installation

### Option 1: Download the ZIP (easiest, recommended)

1. On this repo, click `Code ▶ Download ZIP` (or grab the archive from Releases).
2. **Extract it first** (right-click → "Extract All"). Don't run from inside the archive.
3. In the extracted folder, double-click `시작하기.bat` → `[1] Install`.

### Option 2: git clone

```
git clone https://github.com/sodam-ai/NotebookLM-CLI_One-Click_Kit.git
cd NotebookLM-CLI_One-Click_Kit
```

Then double-click `시작하기.bat` → `[1] Install`.

✂ The `.bat` files must always stay **together in the same folder**.

## Quick Start (3 minutes)

| Step | Do                                 | Notes                                                                      |
|------|------------------------------------|----------------------------------------------------------------------------|
| 1    | Double-click <code>시작하기.bat</code> | A black menu window opens                                                  |
| 2    | Type <code>1</code> → Enter        | Install (6 automatic steps — wait until done)                              |
| 3    | Type <code>2</code> → Enter        | The RUN menu opens                                                         |
| 4    | Type <code>S</code> → Enter        | <b>Easy Start</b> — guided login & AI connection                           |
| 5    | Done!                              | Use <code>[1] Start server</code> , <code>[9] List notebooks</code> , etc. |

## Usage — Menu

### 시작하기.bat (Start Here)

| No. | Action                    |
|-----|---------------------------|
| 1   | Install (run once, first) |
| 2   | Run (open the menu)       |
| 3   | View the guide            |
| 4   | Uninstall                 |
| 0   | Close                     |

## RUN menu — full

| No.      | Action                    | One-line                                                               |
|----------|---------------------------|------------------------------------------------------------------------|
| <b>S</b> | <b>Easy Start</b>         | Do this first (login → AI connection → first notebook)                 |
| <b>T</b> | <b>Glossary</b>           | MCP-pip and other terms in plain words                                 |
| 1        | Start MCP server          | Turn on the bridge for AI assistants (stop with <b>Ctrl+C</b> )        |
| 2        | Google login              | Auto login via Chrome (enter a profile if multiple accounts)           |
| 3        | Check login               | See if you're logged in                                                |
| 4        | Manual login              | Cookie-file login (when auto fails)                                    |
| 5        | <b>Diagnose</b>           | Auto-check the cause ( <b>n1m doctor</b> ) — try this first when stuck |
| 6        | Profiles                  | List registered accounts (profiles)                                    |
| 7        | Logout                    | Delete login data (type <b>yes</b> )                                   |
| 8        | Direct <b>n1m</b> command | Type commands after <b>n1m</b> (advanced)                              |
| 9        | List notebooks            | Show your notebooks                                                    |
| 10       | Create notebook           | Make a new notebook                                                    |
| 11       | AI mode                   | Run <b>n1m --ai</b>                                                    |
| 12       | Version                   | Show installed versions                                                |
| 13       | Update                    | Upgrade to the latest                                                  |
| 14       | Force update              | Force-reinstall the latest                                             |
| 15       | <b>Connect AI tools</b>   | Auto-connect Claude Code · Cursor · JSON                               |
| 16       | Environment info          | Show install path, Python path, etc.                                   |
| 0        | Exit                      | Close the menu                                                         |

**First-time flow:** **[1]** **Install** → **[2]** **Run** → **[S]** **Easy Start** .

## **Connect AI tools (MCP config)**

To use NotebookLM from Claude Code · Cursor:

1. In the RUN menu, type **15** → Enter.
2. Choose **1** (Claude Code) / **2** (Cursor) / **3** (JSON auto) / **4** (manual help).
3. **Fully restart the AI app** to apply.

**Manual JSON** (only if auto fails):

```
{
  "mcpServers": {
    "notebooklm-mcp": { "command": "notebooklm-mcp" }
  }
}
```

**uvx (no install):**

```
{
  "mcpServers": {
    "notebooklm-mcp": { "command": "uvx", "args": ["--from", "notebooklm-mcp-cli", "notebooklm-
mcp"] }
  }
}
```

**Config file locations**

| Tool           | Config file path                            |
|----------------|---------------------------------------------|
| Claude Desktop | %APPDATA%\Claude\claude_desktop_config.json |
| Cursor         | %USERPROFILE%\cursor\mcp.json               |
| VS Code        | %USERPROFILE%\vscode\mcp.json               |
| Gemini CLI     | %USERPROFILE%\gemini\settings.json          |

 **Commands (reference)**

You normally never type these — the menu does it for you. In RUN [8] , type only the part after `n1m` .

| Command                                                                  | Description                                |
|--------------------------------------------------------------------------|--------------------------------------------|
| <code>nlm login</code> / <code>nlm login --check</code>                  | Google login / check login status          |
| <code>nlm notebook list</code> / <code>nlm notebook create "name"</code> | List / create notebooks                    |
| <code>nlm notebook query</code>                                          | Ask a notebook                             |
| <code>nlm source add</code>                                              | Add sources (URL · Text · Drive · File)    |
| <code>nlm studio create</code>                                           | Create Studio content (Audio, Video, etc.) |
| <code>nlm download &lt;type&gt;</code>                                   | Download artifacts                         |
| <code>nlm setup add claude-code cursor</code>                            | Auto-connect an AI tool                    |
| <code>nlm setup list</code> / <code>nlm setup remove &lt;tool&gt;</code> | List / remove connections                  |
| <code>nlm doctor</code>                                                  | Auto-diagnose problems                     |
| <code>nlm --ai</code> / <code>nlm --version</code>                       | AI mode / version                          |
| <code>notebooklm-mcp</code>                                              | Run the MCP server (for AI assistants)     |

## Environment variables

- **This kit needs no environment variables.** Install, login, and connection are all handled by the menu.
- Related items:
  - **PATH** — how your PC finds the `nlm` command. Recognized automatically in a **new window** after install (no setup needed).
  - **Auth data path** — `%USERPROFILE%\notebooklm-mcp-cli` (where Google login data is stored, **on your PC only**).
- No API keys or tokens are entered into or stored by this kit. Google login happens **in the browser**.

## Folder structure

## Build · Test · Distribute

This kit is **compile-free Windows batch scripts (.bat) + documentation**.

- **Build:** there is **no build step**. The `.bat` files and docs are used as-is.
- **Test (run verification):** `시작하기.bat` → `[1] Install` → `[2] Run` → `[5] Diagnose (nlm doctor)`.  
There is no automated test suite; verification is done by **actually double-clicking and running**.
- **Distribute (sharing):**
  1. **Zip/7z** this folder and share it, or
  2. on GitHub use `Code ▶ Download ZIP` or `git clone`.
    - The recipient extracts it and double-clicks `시작하기.bat`.
- **Regenerate PDFs** (developer-only, optional): `pandoc` (Markdown → HTML) + `puppeteer` (HTML → PDF). The temp folder `_build/` is excluded from the repo via `.gitignore`.

## Troubleshooting

💡 Almost everything can be diagnosed with RUN `[5] Diagnose (nlm doctor)`.

| Symptom                       | Fix                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Window closes instantly       | Keep all <code>.bat</code> together → extract the zip → else <code>cd</code> into the folder in <code>cmd</code> and run <code>시작하기.bat</code> (messages stay) |
| <code>nlm</code> not found    | Not installed yet → <code>[1] Install</code>                                                                                                                   |
| Installed but not detected    | Reopen <code>시작하기.bat</code> → <code>[2]</code> (PATH refresh; a new window is needed)                                                                         |
| "Python not found"            | Install Python with "Add Python to PATH" checked                                                                                                               |
| Login window missing / fails  | Check Chrome → <code>[7] Logout</code> → <code>[2] Login</code> , or <code>[4] Manual login</code>                                                             |
| Looks outdated                | <code>[14] Force update</code>                                                                                                                                 |
| Connected but AI can't see it | <b>Fully restart the AI app</b>                                                                                                                                |

## Operational & security notes

- **Auth data location:** `%USERPROFILE%\notebooklm-mcp-cli` stores your Google session. On **shared PCs**, delete it via menu `[7] Logout` after use.
- **MCP config cleanup:** `UNINSTALL.bat` removes the package & auth, but you may need to **manually remove** the `notebooklm-mcp` entry from your AI tool's config JSON.
- **New cmd window:** after install, `nlm` is recognized in a fresh window (PATH refresh).
- **SmartScreen / antivirus:** if a `.bat` triggers a warning, choose "**More info → Run anyway**" (only run sources you trust).
- **.bat encoding:** saved for Korean Windows (CP949), so **Korean comments may look garbled on the GitHub web view, but they run correctly.**
- **No secrets:** this kit does not store or transmit passwords, API keys, or tokens.

## Uninstall

1. `시작하기.bat` → `4` (Uninstall) → Enter
2. Type `yes` to confirm → Enter
3. 6 automatic steps: remove AI links → remove package (uv/pip) → delete auth data → verify
4. Done when "**UNINSTALL COMPLETE**" appears.

⚠️ **Python is kept on purpose** (other programs may use it).

## Upstream package

This toolkit **wraps (installs & runs)** the following open-source package — it is **not bundled/redistributed** here; it is downloaded from PyPI:

- **notebooklm-mcp-cli** by jacob-bd — **MIT License** (PyPI: `notebooklm-mcp-cli`, v0.7.6 as of 2026-06)

## License · Copyright · Commercial use

This kit ( `.bat` · docs)

- **License: Apache License 2.0** (full text in `LICENSE` )
- **Copyright 2026 SoDam AI Studio**
- **Commercial use is allowed.** When you distribute/redistribute, follow Apache-2.0's 4 conditions:
  1. include `LICENSE` · 2. keep `NOTICE` · 3. state your changes · 4. don't misuse SoDam AI Studio's name/marks as an endorsement.

**Underlying tool** `notebooklm-mcp-cli`

- **MIT License** (a separate package — not part of this kit). This kit **only downloads it from PyPI**, so the tool is governed by **its own MIT license**; the **upstream repo's LICENSE is authoritative**.

## Trademarks

- "NotebookLM", "Google", "Chrome" are trademarks of **Google LLC**; "Claude" of **Anthropic**; "Cursor" of its owner.
- This kit is **unofficial** and **not affiliated with, endorsed by, or sponsored by** them. Marks are used for identification only.

## Disclaimer

- This kit is only a helper that installs/runs the public package `notebooklm-mcp-cli` .
- NotebookLM is a **Google service** subject to **Google's Terms of Service**; you are responsible for your use of automation tools.
- Provided **"AS IS"** with **no warranty of any kind**. The author is **not liable** for data loss or account issues.
- Login data is stored **only on your computer**; the kit does not touch system folders.
